

Appln No.: 09/786,502
Amendment Dated: July 25, 2006
Reply to Office Action of May 25, 2006

Amendments to the Specification

Page 6, please amend the paragraph beginning on line 21 as follows:

The cytoplasmic domain portion of the general formula set forth above is selected to enhance the characteristics of the fusion receptor for purposes of promoting a cellular immune response to the antigen recognized by the scFv portion of the fusion receptor. In general, the cytoplasmic domain is the cytoplasmic domain of a molecule which functions as a transducer of a mammalian immune response in the presence of an MHC-peptide complex or costimulatory factor. Representative, non-limiting examples of cytoplasmic domains which may be employed in the present invention include the ζ -chain cytoplasmic domain, the CD28 cytoplasmic domain (particularly a fragment encoded by bases spanning including bases 336 to 663 of CD28 cDNA), 41BB, CD40, ICOS and trance.
